Abstract

Technical appendix to “Optimal Monetary Policy in an Operational Medium-Sized DSGE Model”

JEL Classification: E52, E58

Keywords: Optimal monetary policy, forecasts, judgment

This technical appendix of Adolfson, Laséen, Lindé, and Svensson [1] contains the detailed specification of the matrices A , B , C , and H in the model, as well as the detailed specification of the measurement equation and the related matrices \bar{D}_0 , \bar{D} , and \bar{D}_s .

1. Definition of the matrices A , B , C , D , and H and the instrument rule $[f_X \ f_x]$

We want to identify the submatrices in the model,

$$X_{t+1} = A_{11}X_t + A_{12}x_t + B_1i_t + C\varepsilon_{t+1},$$

$$Hx_{t+1|t} = A_{22}x_t + A_{21}X_t + B_2i_t.$$

We specify the predetermined variables $X_t = (X_t^{\text{ex}}, X_t^{\text{pd}})'$, the forward-looking variables x_t , the policy instrument i_t , and the shock vector ε_t as follows (the number of the elements in each vector

*All remaining errors are ours. The views expressed in this paper are solely the responsibility of the authors and should not be interpreted as reflecting the views of Sveriges Riksbank.

is also listed):

$$X_t^{\text{ex}} \equiv \begin{bmatrix} \hat{\epsilon}_t & 1 & \hat{\tau}_t^y & 21 \\ \hat{\epsilon}_{t-1} & 2 & \hat{\tau}_t^c & 22 \\ \hat{\mu}_{zt} & 3 & \hat{\tau}_t^w & 23 \\ \hat{\mu}_{z,t-1} & 4 & \hat{g}_t & 24 \\ \hat{\nu}_t & 5 & \hat{\tau}_{t-1}^k & 25 \\ \hat{\zeta}_t^c & 6 & \hat{\tau}_{t-1}^y & 26 \\ \hat{\zeta}_t^h & 7 & \hat{\tau}_{t-1}^c & 27 \\ \hat{\zeta}_t^q & 8 & \hat{\tau}_{t-1}^w & 28 \\ \hat{\lambda}_t^f & 9 & \hat{g}_{t-1} & 29 \\ \hat{\lambda}_t^{mc} & 10 & \hat{\pi}_t^* & 30 \\ \hat{\lambda}_t^{mi} & 11 & \hat{y}_t^* & 31 \\ \hat{\phi}_t & 12 & \hat{R}_t^* & 32 \\ \hat{\Upsilon}_t & 13 & \hat{\pi}_{t-1}^* & 33 \\ \hat{z}_t^* & 14 & \hat{y}_{t-1}^* & 34 \\ \hat{z}_{t-1}^* & 15 & \hat{R}_{t-1}^* & 35 \\ \hat{\lambda}_{xt} & 16 & \hat{\pi}_{t-2}^* & 36 \\ \hat{\epsilon}_{Rt} & 17 & \hat{y}_{t-2}^* & 37 \\ \hat{\pi}_t^c & 18 & \hat{R}_{t-2}^* & 38 \\ \hat{\pi}_{t-1}^c & 19 & \hat{\pi}_{t-3}^* & 39 \\ \hat{\tau}_t^k & 20 & \hat{y}_{t-3}^* & 40 \\ & & \hat{R}_{t-3}^* & 41 \end{bmatrix}, \quad X_t^{\text{pd}} \equiv \begin{bmatrix} \hat{k}_t & 1 & 42 & \hat{k}_{t-1} & 16 & 57 \\ \hat{m}_t & 2 & 43 & \hat{q}_{t-1} & 17 & 58 \\ \hat{R}_{t-1} & 3 & 44 & \hat{\mu}_{t-1} & 18 & 59 \\ \hat{\pi}_{t-1}^d & 4 & 45 & \hat{a}_{t-1} & 19 & 60 \\ \hat{\pi}_{t-1}^{mc} & 5 & 46 & \hat{\gamma}_{t-1}^{mcd} & 20 & 61 \\ \hat{\pi}_{t-1}^{mi} & 6 & 47 & \hat{\gamma}_{t-1}^{mid} & 21 & 62 \\ \hat{y}_{t-1} & 7 & 48 & \hat{\gamma}_{t-1}^{x*} & 22 & 63 \\ \hat{\pi}_{t-1}^x & 8 & 49 & \hat{x}_{t-1} & 23 & 64 \\ \hat{w}_{t-1} & 9 & 50 & \hat{m}_{t-1}^x & 24 & 65 \\ \hat{c}_{t-1} & 10 & 51 & \hat{k}_{t-1} & 25 & 66 \\ \hat{i}_{t-1} & 11 & 52 & \hat{u}_{t-1} & 26 & 67 \\ \hat{\psi}_{z,t-1} & 12 & 53 & \hat{\pi}_{t-2}^d & 27 & 68 \\ \hat{P}_{k't-1} & 13 & 54 & \hat{\pi}_{t-2}^{mc} & 28 & 69 \\ \Delta \hat{S}_{t-1} & 14 & 55 & \hat{\pi}_{t-3}^d & 29 & 70 \\ \hat{H}_{t-1} & 15 & 56 & \hat{\pi}_{t-3}^{mc} & 30 & 71 \end{bmatrix},$$

$$\epsilon_t \equiv \begin{bmatrix} \epsilon_{\epsilon t} & \epsilon_{z t} & \epsilon_{\nu t} & \epsilon_{\zeta^c t} & \epsilon_{\zeta^h t} & \epsilon_{\zeta^q t} & \epsilon_{\lambda t} & \epsilon_{\lambda^{mc} t} & \epsilon_{\lambda^{mi} t} & \dots \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & \dots \\ \epsilon_{\tilde{\phi} t} & \epsilon_{\Upsilon t} & \epsilon_{\tilde{z}^* t} & \epsilon_{\lambda_{x t}} & \epsilon_{\epsilon_{R t}} & \epsilon_{\hat{\pi} t} & \epsilon'_{\tau t} & \epsilon'_{x^* t} & & \\ 10 & 11 & 12 & 13 & 14 & 15 & 16 : 20 & 21 : 23 & & \end{bmatrix}'.$$

1.1. Predetermined variables

First we specify the exogenous variables and the shocks, then the endogenous predetermined variables.

Row 1 - Stationary technology shock

$$\hat{\epsilon}_{t+1} = \rho_\epsilon \hat{\epsilon}_t + \sigma_{\epsilon_\epsilon} \epsilon_{\epsilon,t+1}.$$

$$\begin{aligned} \hat{\epsilon}_t & : A_{11}(1,1) = \rho_\epsilon, \\ \epsilon_{\epsilon,t+1} & : C(1,1) = \sigma_{\epsilon_\epsilon}. \end{aligned}$$

The notation means that the value of the persistence of the technology shock, ρ_ϵ , is placed in the first row and first column of the matrix A_{11} . The notation " $\hat{\epsilon}_t :$ " means that the parameter value pertains to that specific variable.

Row 2 - Lagged stationary technology shock

$$\hat{\epsilon}_t = \hat{\epsilon}_t.$$

$$\hat{\epsilon}_t : A_{11}(2,1) = 1.$$

Row 3 - Permanent technology shock

$$\hat{\mu}_{z,t+1} = \rho_{\mu_z} \hat{\mu}_{zt} + \sigma_{\epsilon_z} \epsilon_{z,t+1}.$$

$$\begin{aligned} \hat{\mu}_{zt} & : A_{11}(3,3) = \rho_\epsilon, \\ \epsilon_{z,t+1} & : C(3,2) = \sigma_{\epsilon_\epsilon}. \end{aligned}$$

Row 4 - Lagged permanent technology shock

$$\hat{\mu}_{zt} = \hat{\mu}_{zt}.$$

$$\hat{\mu}_{zt} : A_{11}(4,3) = 1.$$

Row 5 - Firm money demand shock

$$\hat{\nu}_{t+1} = \rho_\nu \hat{\nu}_t + \sigma_{\epsilon_\nu} \epsilon_{\nu,t+1}.$$

$$\begin{aligned} \hat{\nu}_t & : A_{11}(5,5) = \rho_\nu, \\ \epsilon_{\nu,t+1} & : C(5,3) = \sigma_{\epsilon_\nu}. \end{aligned}$$

Row 6 - Consumption preference shock

$$\hat{\zeta}_{t+1}^c = \rho_{\zeta^c} \hat{\zeta}_t^c + \sigma_{\epsilon_{\zeta^c}} \epsilon_{\zeta^c,t+1}.$$

$$\begin{aligned} \hat{\zeta}_t^c & : A_{11}(6,6) = \rho_{\zeta^c}, \\ \epsilon_{\zeta^c,t+1} & : C(6,4) = \sigma_{\epsilon_{\zeta^c}}. \end{aligned}$$

Row 7 - Labor supply shock

$$\hat{\zeta}_{t+1}^h = \rho_{\zeta^h} \hat{\zeta}_t^h + \sigma_{\varepsilon_{\zeta^h}} \varepsilon_{\zeta^h, t+1}.$$

$$\begin{aligned} \hat{\zeta}_t^h & : A_{11}(7, 7) = \rho_{\zeta^h}, \\ \varepsilon_{\zeta^h, t+1} & : C(7, 5) = \sigma_{\varepsilon_{\zeta^h}}. \end{aligned}$$

Row 8 - Household money demand shock

$$\hat{\zeta}_{t+1}^q = \rho_{\zeta^q} \hat{\zeta}_t^q + \sigma_{\varepsilon_{\zeta^q}} \varepsilon_{\zeta^q, t+1}.$$

$$\begin{aligned} \hat{\zeta}_t^q & : A_{11}(8, 8) = \rho_{\zeta^q}, \\ \varepsilon_{\zeta^q, t+1} & : C(8, 6) = \sigma_{\varepsilon_{\zeta^q}}. \end{aligned}$$

Row 9 - Markup shock - domestic firms

$$\hat{\lambda}_{t+1}^d = \rho_{\lambda} \hat{\lambda}_t^d + \sigma_{\varepsilon_{\lambda}} \varepsilon_{\lambda, t+1}.$$

$$\begin{aligned} \hat{\lambda}_t^d & : A_{11}(9, 9) = \rho_{\lambda}, \\ \varepsilon_{\lambda, t+1} & : C(9, 7) = \sigma_{\varepsilon_{\lambda}}. \end{aligned}$$

Row 10 - Shock to substitution elasticity between domestic and foreign consumption goods

$$\hat{\lambda}_{t+1}^{mc} = \rho_{\lambda^{mc}} \hat{\lambda}_t^{mc} + \sigma_{\varepsilon_{\lambda^{mc}}} \varepsilon_{\lambda^{mc}, t+1}.$$

$$\begin{aligned} \hat{\lambda}_t^{mc} & : A_{11}(10, 10) = \rho_{\lambda^{mc}}, \\ \varepsilon_{\lambda^{mc}, t+1} & : C(10, 8) = \sigma_{\varepsilon_{\lambda^{mc}}}. \end{aligned}$$

Row 11 - Shock to substitution elasticity between domestic and foreign investment goods

$$\hat{\lambda}_{t+1}^{mi} = \rho_{\lambda^{mi}} \hat{\lambda}_t^{mi} + \sigma_{\varepsilon_{\lambda^{mi}}} \varepsilon_{\lambda^{mi}, t+1}.$$

$$\begin{aligned} \hat{\lambda}_t^{mi} & : A_{11}(11, 11) = \rho_{\lambda^{mi}}, \\ \varepsilon_{\lambda^{mi}, t+1} & : C(11, 9) = \sigma_{\varepsilon_{\lambda^{mi}}}. \end{aligned}$$

Row 12 - Risk premium shock

$$\hat{\phi}_{t+1} = \rho_{\tilde{\phi}} \hat{\phi}_t + \sigma_{\varepsilon_{\tilde{\phi}}} \varepsilon_{\tilde{\phi}, t+1}.$$

$$\begin{aligned} \hat{\phi}_t & : A_{11}(12, 12) = \rho_{\tilde{\phi}}, \\ \varepsilon_{\tilde{\phi}, t+1} & : C(12, 10) = \sigma_{\varepsilon_{\tilde{\phi}}}. \end{aligned}$$

Row 13 - Investment specific technology shock

$$\hat{Y}_{t+1} = \rho_Y \hat{Y}_t + \sigma_{\varepsilon_Y} \varepsilon_{Y,t+1}.$$

$$\begin{aligned} \hat{Y}_t &: A_{11}(13, 13) = \rho_Y, \\ \varepsilon_{Y,t+1} &: C(13, 11) = \sigma_{\varepsilon_Y}. \end{aligned}$$

Row 14 - Relative (asymmetric) technology shock (between foreign and domestic)

$$\hat{z}_{t+1}^* = \rho_{z^*} \hat{z}_t^* + \sigma_{\varepsilon_{z^*}} \varepsilon_{z^*,t+1}.$$

$$\begin{aligned} \hat{z}_t^* &: A_{11}(14, 14) = \rho_{z^*}, \\ \varepsilon_{z^*,t+1} &: C(14, 12) = \sigma_{\varepsilon_{z^*}}. \end{aligned}$$

Row 15 - Lagged relative (asymmetric) technology shock (between foreign and domestic)

$$\begin{aligned} \hat{z}_t^* &= \hat{z}_t^*. \\ \hat{z}_t^* &: A_{11}(15, 14) = 1. \end{aligned}$$

Row 16 - Markup shock - exporting firms

$$\hat{\lambda}_{x,t+1} = \rho_{\lambda_x} \hat{\lambda}_{xt} + \sigma_{\varepsilon_{\lambda_x}} \varepsilon_{\lambda_x,t+1}.$$

$$\begin{aligned} \hat{\lambda}_{xt} &: A_{11}(16, 16) = \rho_{\lambda_x}, \\ \varepsilon_{\lambda_x,t+1} &: C(16, 13) = \sigma_{\varepsilon_{\lambda_x}}. \end{aligned}$$

Row 17 - Monetary policy shock

$$\epsilon_{R,t+1} = \rho_{\varepsilon_R} \epsilon_{Rt} + \sigma_{\varepsilon_{\varepsilon_R}} \varepsilon_{\varepsilon_R,t+1}.$$

$$\begin{aligned} \epsilon_{Rt} &: A_{11}(17, 17) = \rho_{\varepsilon_R}, \\ \varepsilon_{\varepsilon_R,t+1} &: C(17, 14) = \sigma_{\varepsilon_{\varepsilon_R}}. \end{aligned}$$

Row 18 - Inflation target

$$\hat{\pi}_{t+1}^c = \rho_{\hat{\pi}^c} \hat{\pi}_t^c + \sigma_{\varepsilon_{\hat{\pi}^c}} \varepsilon_{\hat{\pi}^c,t+1}.$$

$$\begin{aligned} \hat{\pi}_t^c &: A_{11}(18, 18) = \rho_{\hat{\pi}^c}, \\ \varepsilon_{\hat{\pi}^c,t+1} &: C(18, 15) = \sigma_{\varepsilon_{\hat{\pi}^c}}. \end{aligned}$$

Row 19 - Lagged inflation target

$$\begin{aligned} \hat{\pi}_t^c &= \hat{\pi}_t^c. \\ \hat{\pi}_t^c &: A_{11}(19, 18) = 1. \end{aligned}$$

Row 20–29 - Fiscal VAR(2)

$$\tau_{t+1} = \tilde{\Theta}_1 \tau_t + \tilde{\Theta}_2 \tau_{t-1} + e_{\tau,t+1}, \quad (1.1)$$

where $\tilde{\Theta}_1 = \Theta_0^{-1} \Theta_1$, $\tilde{\Theta}_2 = \Theta_0^{-1} \Theta_2$ and $e_{\tau t} = \Theta_0^{-1} S_\tau \varepsilon_{\tau t} \sim N(0, \Sigma_\tau)$. Rewrite (1.1) as VAR(1):

$$\begin{bmatrix} \hat{\tau}_{t+1} \\ \hat{\tau}_t \end{bmatrix} = \begin{bmatrix} \tilde{\Theta}_1 & \tilde{\Theta}_2 \\ I & 0 \end{bmatrix} \begin{bmatrix} \hat{\tau}_t \\ \hat{\tau}_{t-1} \end{bmatrix} + \begin{bmatrix} e_{\tau,t+1} \\ 0 \end{bmatrix}$$

$$\begin{aligned} \hat{\tau}_t & : A_{11}(20 : 24, 20 : 24) = \tilde{\Theta}_1, \\ \hat{\tau}_{t-1} & : A_{11}(20 : 24, 25 : 29) = \tilde{\Theta}_2, \\ \hat{\tau}_t & : A_{11}(25 : 29, 20 : 24) = I, \\ \varepsilon_{\tau,t+1} & : C(20 : 24, 16 : 20) = \text{chol} \left(\Theta_0^{-1} S_\tau (\Theta_0^{-1} S_\tau)' \right)'. \end{aligned}$$

Row 30–41 - Foreign VAR(4)

$$X_{t+1}^* = \tilde{\Phi}_1 X_t^* + \tilde{\Phi}_2 X_{t-1}^* + \tilde{\Phi}_3 X_{t-2}^* + \tilde{\Phi}_4 X_{t-3}^* + e_{X^*,t+1}, \quad (1.2)$$

where $\tilde{\Phi}_1 = \Phi_0^{-1} \Phi_1$, $\tilde{\Phi}_2 = \Phi_0^{-1} \Phi_2$, etc., and $e_{X^* t} = \Phi_0^{-1} S_{x^*} \varepsilon_{x^* t} \sim N(0, \Sigma_{x^*})$. Rewrite (1.2) as VAR(1):

$$\begin{bmatrix} X_{t+1}^* \\ X_t^* \\ X_{t-1}^* \\ X_{t-2}^* \end{bmatrix} = \begin{bmatrix} \tilde{\Phi}_1 & \tilde{\Phi}_2 & \tilde{\Phi}_3 & \tilde{\Phi}_4 \\ I & 0 & 0 & 0 \\ 0 & I & 0 & 0 \\ 0 & 0 & I & 0 \end{bmatrix} \begin{bmatrix} X_t^* \\ X_{t-1}^* \\ X_{t-2}^* \\ X_{t-3}^* \end{bmatrix} + \begin{bmatrix} e_{X^*,t+1} \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{aligned} X_t^* & : A_{11}(30 : 32, 30 : 32) = \tilde{\Phi}_1, \\ X_{t-1}^* & : A_{11}(30 : 32, 33 : 35) = \tilde{\Phi}_2, \\ X_{t-2}^* & : A_{11}(30 : 32, 36 : 38) = \tilde{\Phi}_3, \\ X_{t-3}^* & : A_{11}(30 : 32, 39 : 41) = \tilde{\Phi}_4, \\ X_t^* & : A_{11}(33 : 35, 30 : 32) = I, \\ X_{t-1}^* & : A_{11}(36 : 38, 33 : 35) = I, \\ X_{t-2}^* & : A_{11}(39 : 41, 36 : 38) = I, \\ \varepsilon_{x^*,t+1} & : C(30 : 32, 21 : 23) = \text{chol} \left(\Phi_0^{-1} S_{x^*} (\Phi_0^{-1} S_{x^*})' \right)'. \end{aligned}$$

Row 42 - Physical capital stock (note that \hat{k}_{t+1} is predetermined variable no. 42 in period $t + 1$ and forward-looking variable no. 22 in period t):

$$\begin{aligned} \hat{k}_{t+1} & = \hat{k}_{t+1}, \\ \hat{k}_t & : A_{12}(42, 22) = 1. \end{aligned}$$

Row 43 - Financial assets (note that \hat{m}_{t+1} is predetermined variable no. 43 in period $t + 1$ and forward-looking variable no. 23 in period t):

$$\begin{aligned} \hat{m}_{t+1} & = \hat{m}_{t+1}, \\ \hat{m}_{t+1} & : A_{12}(43, 23) = 1. \end{aligned}$$

Row 44–66 - Lagged forward-looking variables

$$\widehat{R}_t : B_1(44, 1) = 1$$

$$\widehat{\pi}_t^d : A_{12}(45, 1) = 1$$

$$\widehat{\pi}_t^{mc} : A_{12}(46, 2) = 1$$

$$\widehat{\pi}_t^{mi} : A_{12}(47, 3) = 1$$

$$\widehat{y}_t : A_{12}(48, 4) = 1$$

$$\widehat{\pi}_t^x : A_{12}(49, 5) = 1$$

$$\widehat{w}_t : A_{12}(50, 6) = 1$$

$$\widehat{c}_t : A_{12}(51, 7) = 1$$

$$\widehat{v}_t : A_{12}(52, 8) = 1$$

$$\widehat{\psi}_{zt} : A_{12}(53, 9) = 1$$

$$\widehat{P}_{k't} : A_{12}(54, 10) = 1$$

$$\Delta \widehat{S}_t : A_{12}(55, 11) = 1$$

$$\widehat{H}_t : A_{12}(56, 12) = 1$$

$$\widehat{u}_t : A_{12}(57, 13) = 1$$

$$\widehat{q}_t : A_{12}(58, 14) = 1$$

$$\widehat{\mu}_t : A_{12}(59, 15) = 1$$

$$\widehat{a}_t : A_{12}(60, 16) = 1$$

$$\widehat{\gamma}_t^{mcd} : A_{12}(61, 17) = 1$$

$$\widehat{\gamma}_t^{mid} : A_{12}(62, 18) = 1$$

$$\widehat{\gamma}_t^{x*} : A_{12}(63, 19) = 1$$

$$\widehat{x}_t : A_{12}(64, 20) = 1$$

$$\widehat{mc}_t^x : A_{12}(65, 21) = 1$$

Row 66 - Lagged physical capital stock

$$\widehat{k}_{t-1} : A_{11}(66, 42) = 1$$

Row 67 - Lagged capacity utilization

$$\widehat{u}_{t-1} \equiv \widehat{k}_{t-1} - \widehat{\bar{k}}_{t-1}$$

$$\widehat{k}_{t-1} : A_{11}(67, 57) = 1$$

$$\widehat{\bar{k}}_{t-1} : A_{11}(67, 66) = -1$$

Rows 68-71 - Lagged inflation

$$\begin{aligned}\hat{\pi}_{t-1}^d & : A_{11} (68, 45) = 1 \\ \hat{\pi}_{t-1}^{mc} & : A_{11} (69, 46) = 1 \\ \hat{\pi}_{t-2}^d & : A_{11} (70, 68) = 1 \\ \hat{\pi}_{t-2}^{mc} & : A_{11} (71, 69) = 1\end{aligned}$$

1.2. Forward-looking variables

Row 1 - Domestic inflation

$$\begin{aligned}\hat{\pi}_t^d - \hat{\pi}_t^c & = \frac{\beta}{1 + \kappa_d \beta} \left(\hat{\pi}_{t+1|t}^d - \rho_{\bar{\pi}^c} \hat{\pi}_t^c \right) + \frac{\kappa_d}{1 + \kappa_d \beta} \left(\hat{\pi}_{t-1}^d - \hat{\pi}_t^c \right) \\ & \quad - \frac{\kappa_d \beta (1 - \rho_{\bar{\pi}^c})}{1 + \kappa_d \beta} \hat{\pi}_t^c + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \left(\widehat{mc}_t^d + \hat{\lambda}_t^d \right), \\ \widehat{mc}_t^d & \equiv \alpha \left(\hat{\mu}_{zt} + \hat{H}_t - \hat{k}_t \right) + \hat{w}_t + \hat{R}_t^f - \hat{\varepsilon}_t, \\ \hat{R}_t^f & = \frac{\nu R}{v(R-1) + 1} \hat{R}_{t-1} + \frac{\nu(R-1)}{v(R-1) + 1} \hat{\nu}_t\end{aligned}$$

$$\widehat{mc}_t^d \equiv \alpha \hat{H}_t - \alpha \hat{k}_t + \hat{w}_t + \frac{\nu R}{v(R-1) + 1} \hat{R}_{t-1} + \frac{\nu(R-1)}{v(R-1) + 1} \hat{\nu}_t - \hat{\varepsilon}_t + \alpha \hat{\mu}_{zt}$$

Rewrite the above equations as:

$$\begin{aligned}-\frac{\beta}{1 + \kappa_d \beta} \hat{\pi}_{t+1|t}^d & = -\hat{\pi}_t^d + \frac{\kappa_d}{1 + \kappa_d \beta} \hat{\pi}_{t-1}^d + \\ & \quad + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \alpha \hat{H}_t - \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \alpha \hat{k}_t \\ & \quad + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \hat{w}_t + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \frac{\nu R}{v(R-1) + 1} \hat{R}_{t-1} + \\ & \quad + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \frac{\nu(R-1)}{v(R-1) + 1} \hat{\nu}_t + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \alpha \hat{\mu}_{zt} \\ & \quad - \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \hat{\varepsilon}_t + \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \hat{\lambda}_t \\ & \quad - \frac{(1 - \kappa_d)(\beta \rho_{\bar{\pi}^c} - 1)}{1 + \kappa_d \beta} \hat{\pi}_t^c.\end{aligned}$$

$$\hat{\pi}_{t+1|t}^d : H(1,1) = -\frac{\beta}{1 + \kappa_d \beta}$$

$$\hat{\pi}_t^d : A_{22}(1,1) = -1$$

$$\hat{\pi}_{t-1}^d : A_{21}(1,45) = \frac{\kappa_d}{1 + \kappa_d \beta}$$

$$\hat{\pi}_t^c : A_{21}(1,18) = 1 - \frac{\beta}{1 + \kappa_d \beta} \rho_{\bar{\pi}^c} - \frac{\kappa_d}{1 + \kappa_d \beta} - \frac{\kappa_d \beta (1 - \rho_{\bar{\pi}^c})}{1 + \kappa_d \beta}$$

$$\hat{\lambda}_t^d : \left[A_{21}(1,9) = \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \right]$$

$$\hat{\lambda}_t^d : A_{21}(1,9) = 1 \quad (\text{rescaled})$$

Marginal cost :

$$\hat{w}_t : A_{22}(1,6) = \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)}$$

$$\hat{H}_t : A_{22}(1,12) = \frac{(1 - \xi_d)(1 - \beta \xi_d)}{\xi_d (1 + \kappa_d \beta)} \alpha$$

Row 21 - Marginal cost export

$$0 = -\widehat{\text{mc}}_t^x + \widehat{\text{mc}}_{t-1}^x + \hat{\pi}_t^d - \hat{\pi}_t^x - \Delta\widehat{S}_t$$

$$\begin{aligned}\hat{\pi}_t^d &: A_{22}(21,1) = 1 \\ \hat{\pi}_t^x &: A_{22}(21,5) = -1 \\ \Delta\widehat{S}_t &: A_{22}(21,11) = -1 \\ \widehat{\text{mc}}_t^x &: A_{22}(21,21) = -1\end{aligned}$$

$$\widehat{\text{mc}}_{t-1}^x : A_{21}(21,65) = 1$$

Row 22 - Physical capital stock (note that \widehat{k}_{t+1} is predetermined variable no. 42 in period $t+1$ and forward-looking variable no. 22 in period t):

$$0 = -\widehat{k}_{t+1} + (1-\tilde{\delta})\frac{1}{\mu_z}\widehat{k}_t - (1-\tilde{\delta})\frac{1}{\mu_z}\hat{\mu}_{zt} + \left[1 - (1-\tilde{\delta})\frac{1}{\mu_z}\right]\hat{Y}_t + \left[1 - (1-\tilde{\delta})\frac{1}{\mu_z}\right]\hat{v}_t,$$

$$\begin{aligned}\widehat{k}_{t+1} &: A_{22}(22,22) = -1, \\ \widehat{k}_t &: A_{21}(22,42) = (1-\tilde{\delta})\frac{1}{\mu_z}, \\ \hat{\mu}_{zt} &: A_{21}(22,3) = -(1-\tilde{\delta})\frac{1}{\mu_z}, \\ \hat{Y}_t &: \left[A_{21}(22,13) = 1 - (1-\tilde{\delta})\frac{1}{\mu_z}\right], \\ \hat{Y}_t &: A_{21}(22,13) = \tilde{S}''\mu_z^2(1+\beta)\left(1 - (1-\tilde{\delta})\frac{1}{\mu_z}\right) \quad (\text{rescaled shock!}) \\ \hat{v}_t &: A_{22}(22,8) = 1 - (1-\tilde{\delta})\frac{1}{\mu_z}.\end{aligned}$$

Row 23 - Financial assets (note that \widehat{m}_{t+1} is predetermined variable no. 43 in period $t+1$ and forward-looking variable no. 23 in period t)

$$0 = -\widehat{m}_{t+1} + \widehat{\mu}_t - \widehat{\mu}_{zt} - \widehat{\pi}_t^d + \widehat{m}_t$$

$$\widehat{m}_{t+1} : A_{22}(23, 23) = -1$$

$$\widehat{\mu}_{zt} : A_{21}(23, 3) = -1$$

$$\widehat{m}_t : A_{21}(23, 43) = 1$$

$$\widehat{\pi}_t^d : A_{22}(23, 1) = -1$$

$$\widehat{\mu}_t : A_{22}(23, 15) = 1$$

1.3. Specifying D

We also specify the target variables, for convenience including some variables of interest which may have zero weight in the loss function. They are the quarterly and four-quarterly CPI inflation gaps relative to steady-state inflation, which equals the official inflation target; the output gap relative to steady-state output (we may also use the gap relative to potential output, meaning the flexprice and flexwage output level); the quarterly interest rate; the quarterly interest-rate differential; and the real exchange rate. The inflation and interest rates are all **measured at an annual rate**. Then the vector of target variables, Y_t , and the corresponding matrix D satisfy

$$Y_t \equiv [4\widehat{\pi}_t^{cpi}, \overline{\widehat{\pi}}_t^{cpi}, \widehat{y}_t, 4\widehat{R}_t, 4(\widehat{R}_t - \widehat{R}_{t-1}), \widehat{x}_t]' \equiv D \begin{bmatrix} X_t \\ x_t \\ i_t \end{bmatrix},$$

where

$$\overline{\widehat{\pi}}_t^{cpi} = \widehat{\pi}_t^{cpi} + \widehat{\pi}_{t-1}^{cpi} + \widehat{\pi}_{t-2}^{cpi} + \widehat{\pi}_{t-3}^{cpi}.$$

Quarterly CPI inflation gap:

$$4\widehat{\pi}_t^{cpi} = 4[(1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)}\widehat{\pi}_t^d + \omega_c(\gamma^{cmc})^{-(1-\eta_c)}\widehat{\pi}_t^{mc}], \quad (1.4)$$

$$\widehat{\pi}_t^d : D(1, n_X + 1) = 4(1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)},$$

$$\widehat{\pi}_t^{mc} : D(1, n_X + 2) = 4\omega_c(\gamma^{cmc})^{-(1-\eta_c)}.$$

Four-quarter CPI inflation gap:

$$\overline{\widehat{\pi}}_t^{cpi} = \widehat{\pi}_t^{cpi} + \widehat{\pi}_{t-1}^{cpi} + \widehat{\pi}_{t-2}^{cpi} + \widehat{\pi}_{t-3}^{cpi}. \quad (1.5)$$

$$\widehat{\pi}_t^d : D(2, n_X + 1) = (1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)},$$

$$\widehat{\pi}_{t-1}^d : D(2, 45) = (1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)},$$

$$\widehat{\pi}_{t-2}^d : D(2, 68) = (1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)},$$

$$\widehat{\pi}_{t-3}^d : D(2, 70) = (1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)},$$

$$\widehat{\pi}_t^{mc} : D(2, n_X + 2) = \omega_c(\gamma^{cmc})^{-(1-\eta_c)},$$

$$\widehat{\pi}_{t-1}^{mc} : D(2, 46) = \omega_c(\gamma^{cmc})^{-(1-\eta_c)},$$

$$\widehat{\pi}_{t-2}^{mc} : D(2, 69) = \omega_c(\gamma^{cmc})^{-(1-\eta_c)},$$

$$\widehat{\pi}_{t-3}^{mc} : D(2, 71) = \omega_c(\gamma^{cmc})^{-(1-\eta_c)}.$$

Alternatively, we could incorporate the exogenous time-varying inflation target in the inflation gap,¹

$$Y_t \equiv [4(\hat{\pi}_t^{cpi} - \hat{\pi}_t^c), \overline{\hat{\pi}}_t^{cpi} - 4\hat{\pi}_t^c, \hat{y}_t, 4\hat{R}_t, 4(\hat{R}_t - \hat{R}_{t-1}), \hat{x}_t]' \equiv D \begin{bmatrix} X_t \\ x_t \\ i_t \end{bmatrix},$$

in which case

$$\begin{aligned} \hat{\pi}_t^c &: D(1, 18) = -4, \\ \overline{\hat{\pi}}_t^c &: D(2, 18) = -4. \end{aligned}$$

Output gap,

$$\hat{y}_t : D(3, n_X + 4) = 1.$$

Interest rate,

$$\hat{R}_t : D(4, n_X + n_x + n_i) = 4.$$

Interest-rate differential,

$$\begin{aligned} \hat{R}_t &: D(5, n_X + n_x + n_i) = 4, \\ \hat{R}_{t-1} &: D(5, 44) = -4. \end{aligned}$$

Real exchange rate,

$$\hat{x}_t : D(6, n_X + 20) = 1.$$

1.4. Defining f_X and f_x - Interest rate rule

$$i_t = f_X \check{X}_t + f_x \check{x}_t$$

$$\begin{aligned} \hat{R}_t &= \rho_R \hat{R}_{t-1} + (1 - \rho_R) \left[\hat{\pi}_t^c + r_\pi (\hat{\pi}_{t-1}^c - \hat{\pi}_t^c) + r_y \hat{y}_{t-1} + r_x \hat{x}_{t-1} \right] \\ &\quad + r_{\Delta\pi} (\hat{\pi}_t^c - \hat{\pi}_{t-1}^c) + r_{\Delta y} (\hat{y}_t - \hat{y}_{t-1}) + \varepsilon_{Rt} \end{aligned}$$

$$\begin{aligned} \hat{R}_t &= \rho_R \hat{R}_{t-1} + (1 - \rho_R) \hat{\pi}_t^c + (1 - \rho_R) r_\pi \hat{\pi}_{t-1}^c - (1 - \rho_R) r_\pi \hat{\pi}_t^c \\ &\quad + (1 - \rho_R) r_y \hat{y}_{t-1} + (1 - \rho_R) r_x \hat{x}_{t-1} + r_{\Delta\pi} \hat{\pi}_t^c - r_{\Delta\pi} \hat{\pi}_{t-1}^c + r_{\Delta y} \hat{y}_t - r_{\Delta y} \hat{y}_{t-1} + \varepsilon_{Rt} \\ &= \rho_R \hat{R}_{t-1} + (1 - \rho_R) [1 - r_\pi] \hat{\pi}_t^c + r_{\Delta\pi} (1 - \omega_c) (\gamma^{cd})^{-(1-\eta_c)} \hat{\pi}_t^d \\ &\quad + r_{\Delta\pi} (\omega_c) (\gamma^{cmc})^{-(1-\eta_c)} \hat{\pi}_t^{mc} \\ &\quad + [(1 - \rho_R) r_\pi - r_{\Delta\pi}] (1 - \omega_c) (\gamma^{cd})^{-(1-\eta_c)} \hat{\pi}_{t-1}^d \\ &\quad + [(1 - \rho_R) r_\pi - r_{\Delta\pi}] \omega_c (\gamma^{cmc})^{-(1-\eta_c)} \hat{\pi}_{t-1}^{mc} \\ &\quad + r_{\Delta y} \hat{y}_t + [(1 - \rho_R) r_y - r_{\Delta y}] \hat{y}_{t-1} + (1 - \rho_R) r_x \hat{x}_{t-1} + \varepsilon_{Rt} \end{aligned}$$

¹ Note that one could alternative replace $4\hat{\pi}_t^c$ by $\hat{\pi}_t^c + \hat{\pi}_{t-1}^c + \hat{\pi}_{t-2}^c + \hat{\pi}_{t-3}^c$ and consider the latter the time-varying four-quarter inflation target.

$$\begin{aligned}
\hat{R}_{t-1} &: f_X(1, 44) = \rho_R \\
\hat{\pi}_t^c &: f_X(1, 18) = (1 - \rho_R)[1 - r_\pi] \\
\hat{\pi}_t^d &: f_x(1, 1) = r_{\Delta\pi}(1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)} \\
\hat{\pi}_t^{mc} &: f_x(1, 2) = r_{\Delta\pi}\omega_c(\gamma^{cmc})^{-(1-\eta_c)} \\
\hat{\pi}_{t-1}^d &: f_X(1, 45) = [(1 - \rho_R)r_\pi - r_{\Delta\pi}](1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)} \\
\hat{\pi}_{t-1}^{mc} &: f_X(1, 46) = [(1 - \rho_R)r_\pi - r_{\Delta\pi}](\omega_c)(\gamma^{cmc})^{-(1-\eta_c)} \\
\hat{y}_t &: f_x(1, 4) = r_{\Delta y} \\
\hat{y}_t^{flex} &: f_x(1, n_x + 4) = -r_{\Delta y} \\
\hat{y}_{t-1} &: f_X(1, 48) = (1 - \rho_R)r_y - r_{\Delta y} \\
\hat{y}_{t-1}^{flex} &: f_X(1, n_X + 48) = -((1 - \rho_R)r_y - r_{\Delta y}) \\
\hat{x}_{t-1} &: f_X(1, 64) = (1 - \rho_R)r_x \\
\varepsilon_{Rt} &: f_X(1, 17) = 1
\end{aligned}$$

2. Potential output under flexible prices and wages - expanding the state

The flexible price and wage model is parameterized under i) $\xi^d = \xi^{mc} = \xi^{mi} = \xi^x = \xi^w = 0$, ii) setting the four markup as well as the fiscal shocks to zero ($\sigma_{\varepsilon_\lambda} = \sigma_{\varepsilon_{\lambda^{mc}}} = \sigma_{\varepsilon_{\lambda^{mi}}} = \sigma_{\varepsilon_{\lambda^x}} = 0$, and $\Theta_0^{-1}S_\tau = 0_{5 \times 5}$, respectively), and iii) we solve the system under the assumption that $\hat{\pi}^{cpi} = 0$. The flexprice model can be written

$$\begin{bmatrix} X_{t+1} \\ H^f x_{t+1|t} \end{bmatrix} = A^f \begin{bmatrix} X_t \\ x_t \\ i_t \end{bmatrix} + \begin{bmatrix} C \\ 0_{n_x \times n_\varepsilon} \\ 0_{n_i \times n_\varepsilon} \end{bmatrix} \varepsilon_{t+1}, \quad (2.1)$$

where,

$$H^f \equiv \begin{bmatrix} H \\ 0_{1 \times n_x} \end{bmatrix}, \quad A^f \equiv \begin{bmatrix} A_{11} & A_{12} & B_1 \\ A_{21} & A_{22} & B_2 \\ 0_{1 \times n_X} & e_1 & 0 \end{bmatrix},$$

and

$$\begin{aligned}
\hat{\pi}_t^d &: e_1(1, 1) = (1 - \omega_c)(\gamma^{cd})^{-(1-\eta_c)}, \\
\hat{\pi}_t^{mc} &: e_1(1, 2) = \omega_c(\gamma^{cmc})^{-(1-\eta_c)}.
\end{aligned}$$

This implies the following solution

$$\begin{aligned}
X_t^{flex} &= M^{flex} X_{t-1}^{flex} + C^{flex} \varepsilon_t, \\
\tilde{x}_t^{flex} &= \tilde{F}^{flex} \tilde{X}_t^{flex}, \\
&= \tilde{F}^{flex} M^{flex} X_{t-1}^{flex} + \tilde{F}^{flex} C^{flex} \varepsilon_t,
\end{aligned}$$

where $\tilde{x}_t^{flex} = \begin{bmatrix} x_t^{flex} \\ i_t^{flex} \end{bmatrix}$ and $\tilde{F}^{flex} = [F_x^{flex} \quad F_i^{flex}]'$.

We expand the state of the distorted economy with the predetermined state variables in the flexprice model so that $\dot{X}_t = (X', X_t^{flex'})'$, which implies

$$\dot{X}_{t+1} = \dot{A}_{11} \dot{X}_t + \dot{A}_{12} x_t + \dot{B}_1 i_t + \dot{C} \varepsilon_{t+1},$$

$$\dot{H}x_{t+1|t} = \dot{A}_{21}\dot{X}_t + \dot{A}_{22}x_t + \dot{B}_2i_t,$$

where $\dot{A}_{11} = \begin{bmatrix} A_{11} & 0_{nX*nX} \\ 0_{nX*nX} & M^{flex} \end{bmatrix}$, $\dot{A}_{12} = \begin{bmatrix} A_{12} \\ 0_{nX*nX} \end{bmatrix}$,

$$\dot{A}_{21} = \begin{bmatrix} A_{21} & 0_{nX*nX} \end{bmatrix}, \dot{A}_{22} = A_{22}, \dot{B}_1 = \begin{bmatrix} B_1 \\ 0_{nX*ni} \end{bmatrix}, \dot{B}_2 = B_2,$$

$$\dot{C} = \begin{bmatrix} C \\ C^{flex} \end{bmatrix}, \text{ and } \dot{H} = H.$$

We also need to change the target variable matrix to include the flexprice output gap

$$Y_t \equiv [4\hat{\pi}_t^{cpi}, \bar{\pi}_t^{cpi}, \bar{\pi}_t^d, (y_t - y_t^{flex}), 4\hat{R}_t, 4(\hat{R}_t - \hat{R}_{t-1}), \hat{x}_t]' \equiv \dot{D} \begin{bmatrix} X_t \\ X_t^{flex} \\ x_t \\ i_t \end{bmatrix}$$

$$\dot{D} = \begin{bmatrix} D_X & D_{X^{flex}} & D_x & D_i \end{bmatrix}'$$

where D above has been partitioned such that $D = \begin{bmatrix} D_X & D_x & D_i \end{bmatrix}'$ and $D_{X^{flex}}$ is defined so that

$$\hat{y}_t^{flex} : D_{X^{flex}}(4, n_X + 4) = -F_{x,4}^{flex}.$$

3. The measurement equation and the definition of the matrices \bar{D}_0 , \bar{D} , and \bar{D}_s

Let $s_t \equiv (X_t', \Xi_{t-1}', x_t', i_t)'$ and call s_t the state of the economy (although it includes nonpredetermined variables). The solution to the model under optimal policy under commitment can be written in Klein form as

$$s_{t+1} \equiv \begin{bmatrix} \tilde{X}_{t+1} \\ x_{t+1} \\ i_{t+1} \end{bmatrix} = \begin{bmatrix} M & 0 & 0 \\ f_x M & 0 & 0 \\ f_i M & 0 & 0 \end{bmatrix} s_t + \begin{bmatrix} I \\ f_x \\ f_i \end{bmatrix} \tilde{C}\varepsilon_{t+1}.$$

As noted in Adolfson et al. [1, Appendix C], it can also be written in AIM form as

$$s_{t+1} = \bar{B}s_t + \bar{C}\varepsilon_{t+1}, \tag{3.1}$$

where

$$\bar{C} \equiv \Phi\Psi$$

and the innovation $\bar{C}\varepsilon_t$ has the distribution $N(0, Q)$ with $Q \equiv E[\bar{C}\varepsilon_{t+1}(\bar{C}\varepsilon_{t+1})'] = \bar{C}\bar{C}'$. Consider the state unobservable, let Z_t denote the n_Z -vector of observable variables, and let the measurement equation be

$$Z_t = \bar{D}_0 + \bar{D}_s s_t + \eta_t, \tag{3.2}$$

where η_t is an n_Z -vector of measurement errors with distribution $N(0, \Sigma_\eta)$ (the vector η_t here should not be confused with vector η of coefficients specified in (1.3)). We assume that the matrix R is diagonal with very small elements.² Equations (3.1) and (3.2) correspond to the state-space form for the derivation of the Kalman filter in Hamilton [3].

Note that the matrix \bar{D}_s is related to the matrix $\bar{D} \equiv [\bar{D}_X \ \bar{D}_x \ \bar{D}_i]$ (partitioned conformably with X_t , x_t , and i_t) as

$$\bar{D}_s = [\bar{D}_X \ 0 \ \bar{D}_x \ \bar{D}_i],$$

since s_t includes the vector of predetermined variables Ξ_{t-1} .

² The role of the measurement errors in the estimation of the model and the state of the economy is further discussed in Adolfson et al. [2].

3.1. Difference specification

The vector of observable variables is

$$Z_t = \begin{bmatrix} \pi_t^d & \Delta \ln(W_t/P_t) & \Delta \ln C_t & \Delta \ln I_t & \hat{x}_t & R_t & \hat{H}_t & \dots \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & \dots \\ \Delta y_t & \Delta \ln \tilde{X}_t & \Delta \ln \tilde{M}_t & \pi_t^{cpi} & \pi_t^{def,i} & \Delta \ln Y_t^* & \pi_t^* & R_t^* \\ 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 \end{bmatrix}' \quad (3.3)$$

and corresponds to the data used in estimating Ramses.

Next, we need specify how the data corresponds to the model variables:

$$\begin{aligned} \pi_t^d &= 400(\pi - 1)\pi + 4\pi\hat{\pi}_t^d, \\ \Delta \ln(W_t/P_t) &= 100 \ln \mu_z + \Delta \hat{w}_t + \hat{\mu}_{zt}, \\ \Delta \ln C_t &= 100 \ln \mu_z + \Delta \hat{c}_t + \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \Delta \hat{\gamma}_t^{mcd} + \hat{\mu}_{zt}, \\ \Delta \ln I_t &= 100 \ln \mu_z + \Delta \hat{i}_t + \frac{\tilde{i}}{\tilde{i}^d + \tilde{i}^m} \eta_i \frac{\tilde{i}^d}{\tilde{i}} \frac{\tilde{i}^m}{\tilde{i}} \left[(\gamma^{i,mi})^{-1} - (\gamma^{i,d})^{-1} \right] \Delta \hat{\gamma}_t^{mi,d} \\ &\quad + \left(1 - \tau^k\right) r^k \bar{k} \frac{1}{\mu_z} \Delta \hat{u}_t + \hat{\mu}_{zt}, \\ \hat{x}_t &= \hat{x}_t, \\ R_t &= 400(R - 1)R + 4R\hat{R}_t, \\ \hat{H}_t &= \hat{H}_t, \\ \Delta y_t &= 100 \ln \mu_z + \Delta \hat{y}_t + \hat{\mu}_{zt}, \\ \Delta \ln \tilde{X}_t &= 100 \ln \mu_z + \Delta \left[\hat{y}_t^* - \eta_f \hat{\gamma}_t^{x,*} + \hat{z}_t^* \right] + \hat{\mu}_{zt}, \\ \Delta \ln \tilde{M}_t &= 100 \ln \mu_z + \frac{c^m}{c^m + \tilde{i}^m} \Delta \hat{c}_t - \frac{c^m}{c^m + \tilde{i}^m} \eta_c (1 - \omega_c) (\gamma^{cd})^{-(1-\eta_c)} \Delta \hat{\gamma}_t^{mcd} \\ &\quad + \frac{\tilde{i}^m}{c^m + \tilde{i}^m} \Delta \hat{i}_t - \frac{\tilde{i}^m}{c^m + \tilde{i}^m} \eta_i (1 - \omega_i) (\gamma^{i,d})^{-(1-\eta_i)} \Delta \hat{\gamma}_t^{mi,d} + \hat{\mu}_{zt}, \\ \pi_t^{cpi} &\equiv 400(\pi - 1)\pi + 4\pi\hat{\pi}_t^{cpi} + 4\pi \frac{\tau^c}{1 + \tau^c} \Delta \hat{\tau}_t^c \\ &= 400(\pi - 1)\pi + 4\pi(1 - \omega_c) (\gamma^{cd})^{-(1-\eta_c)} \hat{\pi}_t^d \\ &\quad + 4\pi\omega_c (\gamma^{cmc})^{-(1-\eta_c)} \hat{\pi}_t^{mc} + 4\pi \frac{\tau^c}{1 + \tau^c} \Delta \hat{\tau}_t^c, \\ \pi_t^{def,i} &= 400(\pi - 1)\pi + 4\pi\tilde{i}_{\pi^d} \hat{\pi}_t^d + 4\pi\tilde{i}_{\pi^m} \hat{\pi}_t^{mi} \\ &\quad + 4\pi \left[\left(\tilde{i}_{\pi^d} - \frac{I^d}{I^d + I^m} \right) \eta_i \omega_i (\gamma^{i,mi})^{-(1-\eta_i)} \right. \\ &\quad \left. - \left(\tilde{i}_{\pi^m} - \frac{I^m}{I^d + I^m} \right) \eta_i (1 - \omega_i) (\gamma^{i,d})^{-(1-\eta_i)} \right] \Delta \hat{\gamma}_t^{mi,d}, \\ \Delta \ln Y_t^* &= 100 \ln \mu_z + \Delta \hat{y}_t^* + \Delta \hat{z}_t^* + \hat{\mu}_{zt}, \\ \pi_t^* &= 400(\pi - 1)\pi + 4\pi\hat{\pi}_t^*, \\ R_t^* &= 400(R - 1)R + 4R\hat{R}_t^*. \end{aligned} \quad (3.4)$$

Domestic inflation

$$\pi_t^d = 400(\pi - 1)\pi + 4\pi\hat{\pi}_t^d,$$

$$\begin{aligned}\bar{D}_0(1,1) &= 400(\pi - 1)\pi \\ \bar{D}_s(1, n_{\bar{X}} + 1) &= 4\pi\end{aligned}$$

Change in real wage

$$\Delta \ln(W_t/P_t) = 100 \ln \mu_z + \hat{w}_t - \hat{w}_{t-1} + \hat{\mu}_{zt},$$

$$\begin{aligned}\bar{D}_0(2,1) &= 100 \ln \mu_z \\ \hat{w}_t &: \bar{D}_s(2, n_{\bar{X}} + 6) = 1 \\ \hat{w}_{t-1} &: \bar{D}_s(2, 50) = -1 \\ \hat{\mu}_{zt} &: \bar{D}_s(2, 3) = 1\end{aligned}$$

Change in real consumption

$$\begin{aligned}\Delta \ln C_t &= 100 \ln \mu_z + \hat{c}_t - \hat{c}_{t-1} + \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \hat{\gamma}_t^{mcd} \\ &\quad - \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \hat{\gamma}_{t-1}^{mcd} + \hat{\mu}_{zt},\end{aligned}$$

$$\begin{aligned}\bar{D}_0(3,1) &= 100 \ln \mu_z \\ \hat{c}_t &: \bar{D}_s(3, n_{\bar{X}} + 7) = 1 \\ \hat{c}_{t-1} &: \bar{D}_s(3, 51) = -1 \\ \hat{\gamma}_t^{mcd} &: \bar{D}_s(3, n_{\bar{X}} + 17) = \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \\ \hat{\gamma}_{t-1}^{mcd} &: \bar{D}_s(3, 61) = -\frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \\ \hat{\mu}_{zt} &: \bar{D}_s(3, 3) = 1\end{aligned}$$

Change in real investment

$$\begin{aligned}\Delta \ln I_t &= 100 \ln \mu_z + \hat{u}_t - \hat{u}_{t-1} + \frac{\tilde{i}}{\tilde{i}^d + \tilde{i}^m} \eta_i \frac{\tilde{i}^d}{\tilde{i}} \frac{\tilde{i}^m}{\tilde{i}} \left[(\gamma^{i,mi})^{-1} - (\gamma^{i,d})^{-1} \right] \hat{\gamma}_t^{mi,d} \\ &\quad - \frac{\tilde{i}}{\tilde{i}^d + \tilde{i}^m} \eta_i \frac{\tilde{i}^d}{\tilde{i}} \frac{\tilde{i}^m}{\tilde{i}} \left[(\gamma^{i,mi})^{-1} - (\gamma^{i,d})^{-1} \right] \hat{\gamma}_{t-1}^{mi,d} \\ &\quad + \left(1 - \tau^k\right) r^k \bar{k} \frac{1}{\mu_z} \hat{k}_t - \left(1 - \tau^k\right) r^k \bar{k} \frac{1}{\mu_z} \hat{k}_t - \left(1 - \tau^k\right) r^k \bar{k} \frac{1}{\mu_z} \hat{u}_{t-1} + \hat{\mu}_{zt}, \\ \hat{u}_t &= \hat{k}_t - \hat{\bar{k}}_t\end{aligned}$$

$$\begin{aligned}
\bar{D}_0(4, 1) &= 100 \ln \mu_z \\
\hat{i}_t &: \bar{D}_s(4, n_{\bar{X}} + 8) = 1 \\
\hat{i}_{t-1} &: \bar{D}_s(4, 52) = -1 \\

$$\begin{aligned} \bar{D}_0(15, 1) &= 400(R - 1)R \\ \hat{R}_t^* &: \bar{D}_s(15, 32) = 4R \end{aligned}$$

3.2. Cointegration specification

The vector of observable variables is

$$Z_t = \begin{bmatrix} \pi_t^d & \ln(W_t/P_t) - \ln Y_t & \ln C_t - \ln Y_t & \ln I_t - \ln Y_t & \hat{x}_t & R_t & \hat{H}_t & \dots \\ 1 & 2 & 3 & 4 & 5 & 6 & 7 & \dots \\ \Delta \ln Y_t & \ln \tilde{X}_t - \ln Y_t & \ln \tilde{M}_t - \ln Y_t & \pi_t^{cpi} & \pi_t^{def,i} & \ln Y_t^* - \ln Y_t & \pi_t^* & R_t^* \\ 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 \end{bmatrix}' \quad (3.5)$$

and corresponds to the data used in estimating Ramses. However, it should be noted that in the current version of [1] we are only using the difference specification in equation (3.3).

Next, we need to specify how the cointegrated data corresponds to the model variables (see the section above for the specification of the non-cointegrated variables):

$$\begin{aligned} \ln(W_t/P_t) - \ln Y_t &= \hat{w}_t - \hat{y}_t, \\ \ln C_t - \ln Y_t &= \hat{c}_t + \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \hat{\gamma}_t^{mcd} - \hat{y}_t, \\ \ln I_t - \ln Y_t &= \hat{i}_t + \frac{\tilde{i}}{\tilde{i}^d + \tilde{i}^m} \eta_i \frac{\tilde{i}^d}{\tilde{i}} \frac{\tilde{i}^m}{\tilde{i}} \left[(\gamma^{i,mi})^{-1} - (\gamma^{i,d})^{-1} \right] \hat{\gamma}_t^{mi,d} + \left(1 - \tau^k \right) r^k \bar{k} \frac{1}{\mu_z} \hat{u}_t - \hat{y}_t, \\ \ln \tilde{X}_t - \ln Y_t &= \hat{y}_t^* - \eta_f \hat{\gamma}_t^{x,*} + \hat{z}_t^* - \hat{y}_t, \\ \ln \tilde{M}_t - \ln Y_t &= \frac{c^m}{c^m + \tilde{i}^m} \hat{c}_t - \frac{c^m}{c^m + \tilde{i}^m} \eta_c (1 - \omega_c) (\gamma^{cd})^{-(1-\eta_c)} \hat{\gamma}_t^{mcd} \\ &\quad + \frac{\tilde{i}^m}{c^m + \tilde{i}^m} \hat{i}_t - \frac{\tilde{i}^m}{c^m + \tilde{i}^m} \eta_i (1 - \omega_i) (\gamma^{i,d})^{-(1-\eta_i)} \hat{\gamma}_t^{mi,d} - \hat{y}_t, \\ \ln Y_t^* - \ln Y_t &= \hat{y}_t^* + \hat{z}_t^* - \hat{y}_t. \end{aligned} \quad (3.6)$$

Real wage

$$\ln(W_t/P_t) = \widehat{w}_t - \widehat{y}_t,$$

$$\begin{aligned}\widehat{w}_t &: \bar{D}_s(2, n_{\tilde{X}} + 6) = 1, \\ y_t &: \bar{D}_s(2, n_{\tilde{X}} + 4) = -1.\end{aligned}$$

Real consumption

$$\ln C_t - y_t = \widehat{c}_t + \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right] \widehat{\gamma}_t^{mcd} - y_t,$$

$$\begin{aligned}\widehat{c}_t &: \bar{D}_s(3, n_{\tilde{X}} + 7) = 1, \\ \widehat{\gamma}_t^{mcd} &: \bar{D}_s(3, n_{\tilde{X}} + 17) = \frac{c}{c^d + c^m} \eta_c \frac{c^d}{c} \frac{c^m}{c} \left[(\gamma^{cmc})^{-1} - (\gamma^{cd})^{-1} \right], \\ \widehat{y}_t &: \bar{D}_s(3, n_{\tilde{X}} + 4) = -1.\end{aligned}$$

Real investment

Foreign output

$$\begin{aligned}\ln Y_t^* - \ln Y_t &= \hat{y}_t^* + \hat{z}_t^* - \hat{y}_t, \\ \hat{z}_t^* &: \bar{D}_s(13, 14) = 1, \\ \hat{y}_t^* &: \bar{D}_s(13, 31) = 1, \\ \hat{y}_t &: \bar{D}_s(13, n_{\tilde{X}} + 4) = -1.\end{aligned}$$

3.3. Smoothed estimates

The Kalman filter calculates a forecast of the state vector s_t , $s_{t|t-1}$, as a linear function of previous observations,

$$s_{t|t-1} \equiv \mathbb{E}[s_t | \mathcal{Z}_{t-1}], \quad (3.7)$$

where $\mathcal{Z}_{t-1} \equiv (Z_{t-1}, Z_{t-2}, \dots, Z_1)$. The matrix $P_{t|t-1}$ represents the MSE of this forecast

$$P_{t|t-1} \equiv \mathbb{E} \left[(s_t - s_{t|t-1}) (s_t - s_{t|t-1})' | \mathcal{Z}_{t-1} \right].$$

The key equations of the Kalman filter are

$$s_{t|t} = s_{t|t-1} + P_{t|t-1} \bar{D}'_s (\bar{D}_s P_{t|t-1} \bar{D}'_s + \Sigma_\eta)^{-1} (Z_t - \bar{D}_0 - \bar{D}_s s_{t|t-1}), \quad (3.8)$$

$$s_{t+1|t} = \bar{B} s_{t|t}, \quad (3.9)$$

$$P_{t|t} = P_{t|t-1} - P_{t|t-1} \bar{D}'_s (\bar{D}_s P_{t|t-1} \bar{D}'_s + \Sigma_\eta)^{-1} \bar{D}_s P_{t|t-1}, \quad (3.10)$$

$$P_{t+1|t} = \bar{B} P_{t|t} \bar{B}' + Q. \quad (3.11)$$

The smoothed estimates of s_t , $s_{t|T}$ for $t \leq T$, are denoted

$$s_{t|T} \equiv \mathbb{E}[s_t | \mathcal{Z}_T]. \quad (3.12)$$

The sequence of smoothed estimates $\{s_{t|T}\}_{t=1}^T$ can be calculated by first calculating the sequences $\{s_{t|t}\}_{t=1}^T$, $\{s_{t+1|t}\}_{t=1}^{T-1}$, $\{P_{t|t}\}_{t=1}^T$ and $\{P_{t+1|t}\}_{t=1}^{T-1}$ and then calculate

$$s_{t|T} = s_{t|t} + P_{t|t} \bar{B}' P_{t+1|t}^{-1} (s_{t+1|T} - s_{t+1|t}) \quad (3.13)$$

by iterating backward through the sample for $t = T - 1, T - 2, \dots, 1$ (Hamilton [3, chapt. 13.6]).
